

# Fast detector simulation and anomaly detection using Graph variational autoencoders

December 7, 2023

# Collisions at the LHC

- ▶ In the CMS and ATLAS detectors at LHC, opposing proton beams are smashed[3]
- ▶ By products are measured using various sub-detectors
- ▶ Trackers track the trajectories of photons and charged particles
- ▶ ECAL measures the transverse momenta of electrons/photons and cylindrical coordinates
- ▶ HCAL measures the transverse momenta of hadrons and cylindrical coordinates

# The generated image

- From hits in a subdetector, we get “images” wrt  $\phi$  and  $\eta[2]$

(a) Barrel section of composite image in ECAL-centric geometry. Image resolution:  $170 \times 360$ .

(b) Endcap sections of composite image in ECAL-centric geometry. Image resolution:  $100 \times 100$ .

Imagine making a (finite) cylinder out of paper

# Cross section of the CMS detector

## CMS DETECTOR

Total weight : 14,000 tonnes  
Overall diameter : 15.0 m  
Overall length : 28.7 m  
Magnetic field : 3.8 T

STEEL RETURN YOKE  
13,500 tonnes

SILICON TRACKERS  
Pixel (100x150  $\mu\text{m}$ )  $\sim 1\text{m}^2 \sim 6600$  channels  
Microstrips (80x180  $\mu\text{m}$ )  $\sim 200\text{m}^2 \sim 6.6\text{M}$  channels

SUPERCONDUCTING SOLENOID  
Nickelium titanium coil carrying  $\sim 18,000\text{A}$

MUON CHAMBERS  
Barrel: 250 Drift Tubes, 600 Resistive Plate Chambers  
Endcaps: 340 Cathode Strip, 376 Resistive Plate Chambers

PRESHOWER  
Silicon strips  $\sim 10\text{m}^2 \sim 137,000$  channels

FORWARD CALORIMETER  
Steel + Quartz Fibre  $\sim 2,000$  Channels

CRYSTAL  
ELECTROMAGNETIC  
CALORIMETER (ECAL)  
 $\sim 76,000$  scintillating PbWO<sub>4</sub> crystals

HADRON CALORIMETER (HCAL)  
Beam + Plastic scintillator  $\sim 7,000$  channels

# Simulating the collisions

- ▶ Hard(core) scattering
- ▶ Secondary collisions
- ▶ Decays and radiative correction
- ▶ Hundreds of different processes, everything Monte Carlo!

# Hard scattering

- ▶ The moments right after the primary collision...
- ▶ Modeled using perturbative QCD- cross sections are given by Feynman diagrams
- ▶ The initial/final states are not eigenstates of unperturbed theory, unlike QED
- ▶ Higher order loops with IR divergences require very precise Monte Carlo or analytical estimates

## Secondary collisions/processes

- ▶ Non-relativistic QCD and semi-classical approximations for decay processes
- ▶ Highly empirical, sometimes benchmarked by detector calibrations
- ▶ Factorization theorems and Parton Distribution functions
- ▶ General purpose libraries- PYTHIA, SHERPA[7]

# Detector effects and ML models

- ▶ GEANT4 has extremely precise models of detector interaction with final product states[1]
- ▶ The entire simulation pipeline can take days to run on supercomputers, for sufficient hits/samples
- ▶ Non ML alternatives to GEANT4 (like DELPHES) tradeoff precision for speed[4]
- ▶ ML models fit precise data to well-behaved functions- similar to variational inference of energy eigenstates in quantum systems

# Generative ML for end to end simulation

- ▶ Particle hit images are inherently probabilistic- so ML models approximate probability distributions on the data
- ▶ Dominant Generative ML paradigms- VAE, GAN, NF
- ▶ Popular implementations use convolution layers to generate pixel by pixel
- ▶ Downside- detector hits are highly sparse which limit applicability of convolutions

Ah [censored], here we go again.

# Sample detector image

(a) Barrel section of composite image in ECAL-centric geometry. Image resolution:  $170 \times 360$ .

(b) Endcap sections of composite image in ECAL-centric geometry. Image resolution:  $100 \times 100$ .

# Graph modeling and message passing convolutions

- ▶ Number of non-zero pixels  $\ll$  Total number of pixels [6]
- ▶ We model non-zero hits alone, and their positions
- ▶ Assume each hit depends on nearest neighbor hits
- ▶ Graph message passing implements precisely this[5]
- ▶ Output invariant of order of nodes or their neighbors- similar to translation invariance in CNNs

# Some initial results

Quark jet

# An anomaly

Gluon jet
